collodion (ko̤-lō′di-o̤n), *n.* [NL., also *collodium*, < Gr. *κολλώδης*, like glue, < *κόλλα*, glue, + *εἶδος*, semblance.] A substance prepared by dissolving pyroxylin or guncotton in ether, or in a mixture of ether and alcohol. It forms a useful substitute for adhesive plaster in the case of slight wounds. When the solution is applied to the wound, it immediately dries in a semi-transparent, tenacious film, which adheres firmly to the part, and protects the wound or abrasion. With the addition of a small quantity of iodides and bromides, collodion is employed as the basis of a photographic process, called the *collodion* or *wet process*. To obtain a negative picture by this process, a glass plate is covered with a film of collodion, which is sensitized by a salt (usually the nitrate) of silver, and the plate exposed in the camera. The latent image obtained is then developed by the application of a solution of iron protosulphate, water, and acetic acid, and the unprecipitated silver remaining in the film is dissolved by a fixing solution of sodium hyposulphite or of potassium cyanide. To obtain a positive picture, a sheet of paper is laid upon the face of the negative in a frame, the paper having been sensitized by floating on a solution of silver nitrate, or by any other of several methods. The frame is then exposed to light in such a manner that the rays, to reach the paper, must pass through the negative, and the exposure is continued till the tone is sufficiently deep, after which the tint is improved by means of gold chlorid and other salts, and the picture fixed with sodium hyposulphite. Positive pictures may also be obtained direct by the collodion process. Collodion is used also as a water-proof coating in place of varnish, especially to protect lucifer matches from the effects of dampness.

The fruit is a round gourd, resembling an orange in size and appearance, with many seeds embedded in a light and spongy pulp, which is very bitter. It is used in medicine as a purgative. The seeds are an article of food in some parts of Africa.

See *colon*^{1}, 2.—**2.** In *paleography,* measurement of manuscripts by cola or lines of determinate length; stichometry. See *stichometry* and *colon*^{1}, 3.

colon^{1} (kō'lo̤n), *n.*; pl. *cola* (-lạ̈) in senses 1, 2, and 3, *colons* (-lo̤nz) in sense 4. [= D. *colon* = G. Dan. Sw. *kolon* = F. Sp. Pg. *colon* = It. *colon, colo,* < L. *cōlon,* a member of a verse or poem, < Gr. *κῶλον,* a member, limb, clause, part of a verse.] **1.** In *anc. gram.* and *rhet.,* one of the larger or principal divisions of a sentence or period; a long clause, or a group of minor clauses or commata. See *comma,* 1.—**2.** In *anc. pros.,* one of the members or sections of a rhythmical period, forming an uninterrupted sequence of feet, united under a principal ictus or beat: sometimes called a *series.* A colon could not consist of more than 6 trisemic, 5 tetrasemic or pentasemic, or 3 hexasemic feet. It usually corresponded to one of the lines of a modern couplet, triplet, or stanza, or formed part only of a longer line. A *pure colon* is a colon consisting of feet of one kind only; a *mixed colon* is composed of feet of different kinds. See *period.*
3. In *paleography,* a long clause or group of clauses, or a series of words of about the average length of such a group, estimated as approximately equal to a dactylic hexameter in extent—that is, as containing from 12 to 17 syllables. A colon in this sense was frequently written as a separate line in manuscript, and served to measure the length of a book or treatise. See *colometry* and *epos.*
4. A mark of punctuation formed by two dots like periods placed one above the other (:), used to mark a discontinuity of grammatical construction greater than that indicated by the semicolon and less than that indicated by the period. The colon is commonly used (1) to emphasize a close connection in thought between two clauses of which each forms a complete sentence, and which might with grammatical propriety be separated by a period; (2) to separate a clause which is grammatically complete from a second which contains an illustration or amplification of its meaning: thus, in this work illustrative clauses introduced by "as" are separated from the definition by a colon; (3) to introduce a formal statement, an extract, a speech in a dialogue, etc. Originally it was the mark of the termination of the grammatical or paleographic division called by the same name, and it is now frequently used to mark off metrical periods in prose intended for chanting.

colon^{2} (kō'lo̤n), *n.*; pl. *colons* (-lo̤nz), *cola* (-lạ̈). [= D. *colon* = G. Dan. Sw. *kolon* = F. Sp. Pg. *colon* = It. *colon,* < L. *cōlon, cōlum* (prop. *cŏlon, cŏlum*), < Gr. *κόλον* (sometimes incorrectly written *κῶλον* by confusion with *κῶλον,* a member: see *colon*^{1}), the large intestine, also food, meat, fodder. Hence *colic.*] **1.** In *anat.,* a portion of the intestinal tract, the so-called "large" as distinguished from the "small" intestine, continuous from the ileum to the rectum; the great gut, beginning at the cæcum and ending in the sigmoid flexure. In man and mammals generally the colon is distinguished from the preceding small intestine by its greater caliber, and by its sacculation, due to the particular distribution of its circular muscular fibers, which constrict it at some places and allow it to bulge out at others, making a series of pouch-like expansions. It may also present continuous bands of longitudinal fibers, or lengthwise constrictions, so that the cross-section is not circular. The colon may not be distinguishable in size or appearance from the rest of the intestine, as in birds, where its commencement is marked only by the presence of a cæcum or of two cæca; and when these are wanting, there is no distinction. In man the course and situation of the colon are definite, owing to the binding of the gut in place by the mesocolon and gastrocolic omentum. Beginning at the cæcum and ascending by the right kidney, it passes under the concave surface of the liver and the bottom of the stomach to the spleen; thence descending by the left kidney, it passes in the form of an S to the upper part of the sacrum, where it becomes the rectum. The parts of the colon are designated according to their position or direction: as, the *right lumbar* or *ascending colon;* the arch of the colon, or *transverse colon;* the *left lumbar* or *descending colon;* and the sigmoid flexure, or *left iliac colon.* See cuts under *alimentary* and *intestine.*
2. In *entom.,* the second portion of an insect's intestine, generally broader than the preceding portion or ileum. It may be straight or convoluted, terminating at the anal opening, or separated from it by a short rectum.

Pg. form is due to dissimilation, or perhaps to association with Sp. L. *corona,* Pg. *corõa,* a crown; cf. Sp. dim. *coronel,* a crown (in heraldry): see *coronal.* The E. word, orig. pron. as spelled, *cor-o-nel', cor'o-nel,* became, by regular phonetic change, *cor'nel,* and now *cur'nel* (kėr'ne̤l) (being often so spelled in novels and character sketches which seek to be realistic), retaining the *r* of its Sp. form; but the spelling was soon changed to suit the F. form, which was much more familiar to the eye of readers. Hence the later occasional pronunciations kol-ō̤-nel', kol'ō̤-nel.] The chief commander of a regiment of troops, whether infantry or cavalry, next in rank below that of a general officer—in the United States army, of a brigadier-general. In the British army, except in the artillery and engineers, the office of colonel is often honorary, and is generally conferred on distinguished officers and princes of the blood royal, the real command resting with the lieutenant-colonel in each battalion, who after five years of service becomes a colonel. Generals who have had what is called "a regiment given to them" as a reward for service, and virtually as a retirement, have the rank of colonel. In the Russian, German, and Austrian armies the colonel of each regiment, holding the title only as an honor, is usually a member of some princely or other eminent family, often foreign, and sometimes appointed in childhood. Often, as a title, abbreviated *Col.*

It. *colonia*, < L. *colonia*, a colony, < *colonus*, a husbandman, colonist, < *colere*, till, cultivate, dwell: see *cult*, *cultivate*, etc.] 1. A company or body of people who migrate from their native country or home to a new province, country, or district, to cultivate and inhabit it, but remain subject to or intimately connected with the parent state; also, the descendants of such settlers so long as the connection with the mother country is retained. Among the ancient Greeks the simple colony, which was not necessarily dependent upon the parent state except in religious matters, must be distinguished from a *cleruchy* (which see). Among the Romans the earliest colonies, so called, were merely garrisons in a hostile territory. Later, colonies were founded for the benefit of the poor of Rome; but Sylla restored the military character to the colony, which became in general a foundation for the benefit of veteran soldiers who had served their time. The colonists retained their Roman citizenship, and received their lands by lot, the original inhabitants of the site being subordinated to them. In American history the name is given especially to the thirteen separate communities along the Atlantic coast under English rule which combined in the revolution, and were formed in 1776 into the United States of America. They were (in geographical order) New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, North Carolina, South Carolina, and Georgia. These were all originally English colonies excepting New York and Delaware, which were for a time respectively Dutch (as New Netherland) and Swedish (as New Sweden). Their governments were by charter (in Massachusetts, Rhode Island, and Connecticut), proprietary (in Pennsylvania, Delaware, and Maryland), or royal (in the remaining colonies). In each (except Rhode Island and Connecticut, which chose their own governors) the governor was appointed by the crown or by the proprietaries. The crown claimed a veto on legislation, and jurisdiction of appeals from the court of last resort.

> Once on a time thirteen famous *colonies* of the older England voted that they were and ought to be free and independent States. By that vote they ceased, in the sense of a colonial office, to be English *colonies* any longer. In the sense of history they became English *colonies* more truly than before. *E. A. Freeman*, Amer. Lects., p. 25.

color, colour (kul′ọr), *n.* [The second spelling is still prevalent in England; early mod. E. *colour*, *color*, *coloure*, *collour*, < ME. *colour*, *colur*, *culur*, rarely *color*, < AF. *culur*, OF. *colur*, *color*, *colour*, *coulour*, mod. F. *couleur* (> D. *kleur* = Dan. *kulör* = Sw. *kulör*) = Pr. Sp. Pg. *color* (Pg. also contr. *cor*) = It. *colore*, < L. *color* (*color-*), OL. *colos* (cf. *arbor*[1]), color, tint, orig. a covering, from the root of *celare*, cover, hide, *occultare*, hide: see *conceal* and *occult.* For the transfer of sense, cf. Gr. *χροιά*, *χρόα*, surface, skin, color.] 1. Objectively, that quality of a thing or appearance which is perceived by the eye alone, independently of the form of the thing; subjectively, a sensation, or the class of sensations, peculiar to the organ of vision, and arising from stimulation of the optic nerve. The proper stimulus to the sensation of color is light radiated from a luminous body or reflected from the surface of a non-luminous body; but it can be induced by other means, as by an electric shock. When a ray of white light is analyzed, as by a prism, into parts each of a definite wave-length, the parts show the colors red, orange, yellow, green, blue, indigo, and violet, which form a continuous spectrum, each color shading gradually into the next. (See *light* and *spectrum.*) These colors have been termed *primary* or *simple*, though in fact they do not excite simple color-sensations. If the colors of the spectrum are recombined, white light reappears. Similarly, if two colors which lie near together in the spectrum, both on the same side of light of wave-length 0.524 micron, are mixed (for example, if two rays of colored light are thrown upon the same spot so as to be reflected from it together), the intermediate colors are nearly produced. If, however, the colors, being on different sides of that point, are taken further and further apart in the spectrum, the mixture becomes gradually whiter (less saturated) until two colors are found which produce pure white light. If the colors are still further removed, a purple results. Those pairs of colors which when mixed produce white or gray light are called *complementary colors;* such are red and green-blue, orange and blue, yellow and indigo-blue, green-yellow and violet. The sensations produced by the different parts of the spectrum, however, vary with the intensity of the light: thus, orange when highly illuminated looks more yellow than when darker, and the main effect of increasing the illumination of a color is to add a yellow color-sensation, called the *color of brightness.* If, instead of mixing spectral colors, colored pigments are mixed, very different results are obtained: thus, while spectral blue and yellow produce white, blue and yellow pigments produce green. This is due to the fact that the blue pigment absorbs nearly all the yellow and red light, while the yellow pigment absorbs the blue and violet light, so that only the green remains to be reflected. Colors vary in *chroma*, or freedom from admixture of white light; in brightness or *luminosity;* and in *hue*, which roughly corresponds to the mean wave-length of the light emitted. The numbers which measure these quantities, as well as any other system of three numbers for defining colors, are called *constants of color.* Pure white light and darkness are not ordinarily regarded as colors; but white and black objects are commonly spoken of as colored, although the former reflect and the latter absorb all the rays of light without separating them into colors properly so called.

2. In *painting:* (*a*) The general effect of all the hues entering into the composition of a picture. (*b*) An effect of brilliancy combined with harmony: said either of a work in different colors or of a work in monochrome, or of an engraving: as, the picture has no *color;* the engraving is full of *color.*

> Though there is no *colour*, strictly speaking, in an engraving consisting merely of black and white lines, yet the term is often . . . applied to an engraving which is supposed, from the varied character of its lines and the contrast of light and shade, to convey the idea of varied local *colour* as seen in a painting. *Chatto*, Wood Engraving, p. 213.

3. Any distinguishing hue, or the condition of having a distinguishing hue—that is, a hue different from that which prevails among objects of the kind concerned, whether the prevailing hue be positive, as green, or neutral or negative, as white or black; hence, (*a*) in a picture or view, or in a fabric or other material dyed or painted, any hue, especially a pure tint (often implying a vivid one), other than black and white; (*b*) in human beings, from the standpoint of the white races, a hue or complexion other than white, and especially black; (*c*) in *bot.*, any hue except green. See *colored*, 2.—4. The natural hue of the face; a red or reddish tint; flush; blush; complexion in general.

According to the Roman sequence of colors, white, as the color of purity and joy, is used on the festivals of Christ, the Virgin, angels, and saints not martyrs, and at marriages; red, as the color of blood, on the feasts of the Holy Cross and of martyrs, and also at Whitsuntide with reference to the tongues of fire (Acts ii. 3); violet or purple, as the penitential color, in Advent, Septuagesima, etc., Lent, and on vigils, etc.; green, the prevailing color of natural vegetation, and symbolic of hope, on days and during seasons not otherwise distinguished, especially from Trinity to Advent Sunday, both exclusive; black, on Good Friday, at funerals, and at services for the departed. These colors are widely used in Anglican churches also, though less frequently for vestments than for hangings. Some Anglican churches have revived the old English or Sarum colors, namely, red as the ordinary Sunday color, as a penitential color on Ash Wednesday, Good Friday, Easter Even, and Whitsun Even, and also on the same days as in the Roman use; white, throughout Eastertide; yellow, for feasts of confessors; blue, indifferently with green; and brown or gray with violet, for penitential seasons. They are afterward varnished, which brings out the brilliancy of color.—**Law of color,** the principle that every color of the spectrum can be matched by a mixture of some two out of three colors, namely, the scarlet vermilion of the spectrum at wave-length 0.639 (Angström), the pure blue of the spectrum at wave-length 0.464, and a green a little more intense than the pure green of the spectrum at wave-length 0.524, except only that the green of the spectrum contains a little of both red and blue.—**Liturgical colors.** See *ecclesiastical colors*, above.—**Local color.** (*a*) In *painting*, the hue, or combination of hues, special to any object or part. Thus, if A, B, and C are the lights thrown upon the retina by three colors, and another color projects a light which is the sum of $\frac{1}{2}$ A, $\frac{3}{8}$ B, and $\frac{1}{8}$ C, then the latter is said to be a *mixture* of A, B, and C.—**Moist color.** See *water-color*, below.—**Neutral color,** a color which matches a mixture of white and black.—**Oil-color,** a pigment of any kind ground in linseed- or poppy-oil. (*b*) The colors red, yellow, and blue, from the mixture of which it was erroneously supposed (from the facts of the mechanical mixture of pigments) all other colors could be produced. (*c*) The red, green, and violet light of the spectrum, from the mixture of which all other colors can be produced. Also called *fundamental colors*.—**Pulp-colors,** the name given by paper-stainers and calico-printers to colors ground in water.—**Pure color.** (*a*) A color produced by homogeneous light. (*b*) Any very brilliant or decided color. (*c*) In *painting*, color in which each hue is lighted or shaded only with a modification of itself, and not with a totally different hue. Thus, a brick wall painted in *pure color* will be red in both sunlight and shadow, as distinguished from a representation of such a wall as red in the sun, and blue, gray, or brown in the shade.—**Secondary colors.** See *secondary*.—**Spirit colors,** certain colors obtained in calico-printing, so called from the use of "spirits," the technical name for the acid solutions of tin, in applying the colors. They are soft, and form when applied a kind of glaze upon the surface of the glass.—**Vitrifiable colors,** the oxids of various metals ground to a paste in a medium, usually oil of turpentine, and used for decorating pottery. The colors are developed by being fused into the glaze at a high temperature in a kiln.—**Water-color.** (*a*) A pigment ground in water containing a small amount of glue, glycerin, honey, or molasses, to cause it to bind and adhere to the surface on which it is applied. When pressed into molds and thoroughly dried, they are called *cake-colors*; but when sold in the form of a stiff paste they are called *moist colors*. (*b*) A painting done in such pigments.—**Young-Helmholtz theory of color** [named for Thomas Young (1773–1829), who, however, did not prove the theory, and Hermann Ludwig Ferdinand Helmholtz, born 1821], the doctrine that there are three kinds of nerves in the retina, giving respectively sensations of red, green, and violet, and that all other color-sensations are due to the simultaneous excitation of two kinds of nerves or of all three.=**Syn.** **1.** *Shade, Tint*, etc. See *hue*^{1}.—**10.** Plea, pretext, semblance, disguise.

Another engineer had by some oversight not been tested in his division, and this led to his examination and . . . conviction by the writer as a *color-blind.* *Pop. Sci. Mo.,* XXVI. 438.

color-blindness (kul'o̤r-blīnd"nes), *n.* Incapacity for perceiving colors, independent of the capacity for distinguishing light and shade, and form. It is not a mere incapacity for distinguishing colors (for this might be due to want of training), but an absence or great weakness of the sensations upon which the power of distinguishing colors must be founded. Color-blindness may be *total,* that is, the absence of all perception of colors as such, independently of light and shade, all colors appearing simply as shades; or *partial,* the entire or partial inability to distinguish particular colors independently of difference of light and shade. The most common form of the latter defect is the inability to perceive red as a distinct color, red objects being confounded with gray or green, and next in frequency is the inability to perceive green. The color which to a normal eye is complementary to the defective color appears as gray; and a mixture of white and black (gray) of the proper luminosity certainly cannot be distinguished by the color-blind from the defective color (red or green). The results of statistical inquiries as to the prevalence of color-blindness show its existence in from 2 to 8 per cent. of males, while among women the number of cases seems to be considerably under 1 per cent. Also called *daltonism* and *achromatopsia.*

Specific categories of color-variation are *albinism, melanism,* and *erythrism.* (See these words.) The regular occurrence of some kinds of color-variation is called *dichromatism,* examples of which are the gray and red phases of many owls, and the white or colorless and variously colored phases of many herons. D. 80. A large portion of the structure still exists, part of the wall being entire. The outline of the Colosseum is elliptic, the exterior length of the building being 607 feet, and its breadth 512 feet; it is pierced with 80 vaulted openings or vomitories in the ground story, over which are superimposed on the exterior face three other stories, the whole rising perpendicularly to a height of 159 feet. The lower story is decorated between the arches with Doric semi-columns; the second and third stories, also with arched openings, bear respectively Ionic and Corinthian semi-columns; and the fourth story, which is higher than the others, and walled in, bears an equal number of Corinthian pilasters, and is pierced in alternate intercolumniations with rectangular windows, and in the remaining intercolumniations with smaller rectangular openings at a lower level. The arena is 253 by 153 feet, and covers extensive substructions provided for the needs and machinery of ordinary gladiatorial displays, and for the flooding of the arena to convert the amphitheater into a place for naval contests when required. A system of awnings was provided for shading the entire interior. It is estimated that the Colosseum provided seats for 87,000 spectators. The exterior of the building is faced with blocks of travertin; the interior is built of brick, with considerable use of marble. See *amphitheater.*

From L. *columna* come also ult. E. *colonel*, *colonnade*, etc.] 1. A solid body of greater length than thickness, standing upright, and generally serving as a support to something resting on its top; a pillar; more specifically, as an architectural term, a cylindrical or slightly tapering or fusiform body, called a *shaft*, set vertically on a stylobate, or on a congeries of moldings which forms its *base*, and surmounted by a spreading mass which forms its *capital*. Columns are distinguished by the names of the styles of architecture which they represent: thus, there are Egyptian, Grecian, Roman, and medieval columns. In classic architecture they are further distinguished by the names of the orders to which they belong, as Doric, Ionic, or Corinthian columns; and again, in various styles, by some peculiarity of position, of construction, of form, or of ornament, as attached, twisted, cabled or rudented, and carolitic columns. Columns are used chiefly in the construction or adornment of buildings. They are also used singly, however, for various purposes: as, the *astronomical column*, from which astronomical observations are made; the *chronological column*, inscribed with a record of historical events; the *gnomonic column*, which supports a dial; the *itinerary column*, pointing out the various roads diverging from it; the *milliary column*, set up as a center from which to measure distances; the *triumphal column*, dedicated to the hero of a victory, etc.

> *U. S. Grant*, Personal Memoirs, I. 524.

7. *Naut.*, a number of ships following one another.—8. In *printing*, one of the typographical divisions of printed matter in two or more vertical rows of lines. The separation of columns is made by a narrow blank space in which is sometimes placed a vertical line or rule. Division into columns economizes space, and saves the fatigue of the eye arising from attempts to trace the connection of an over-long line with the following line.

Hence—9. The contents of or the matter printed in such a column, especially in a newspaper: as, the *columns* of the daily press.—10. 3. The fleshy crest or caruncle growing, in one of several forms, on the head of the domestic fowl, and particularly developed in the male birds: so called from its serrated indentures in the typical form, or single comb, which resemble the teeth of a comb. Several characteristic variations in the form of the comb have received distinctive names. An *antlered comb* is one having more or less the form of a stag's antlers, as seen in Polish and La Flèche fowls, often in Houdans, etc. The *leaf-comb* has much the form of a strawberry-leaf, set transversely on the head. It is the preferable form of comb in Houdan fowls. The *pea-comb* appears as if formed of three low, bluntly serrated combs set side by side on the head, the middle one of the three being the highest. It is the typical comb of the Brahma fowls. A *rose-comb* is a low comb set flat on the head, like a cap, broad in front, and tapering to a projecting spike behind, the upper part being evenly covered with small projections. It is best illustrated in the Hamburg fowls, and is also found in the Wyandotte, the Sebright bantam, and other varieties. The *strawberry-comb* resembles a half of a strawberry, generally somewhat wrinkled, and set well forward on the head. It is characteristic of the Malay and the Sumatra fowls.

comburgess (kom-bėr'jes), *n.* [= F. *combourgeois*, < ML. *comburgensis*, a fellow-burgess: see *com-* and *burgess.*] A fellow-burgess: a term formerly used in England of one who was a member or an inhabitant of the same borough with another, particularly of a member of Parliament who was a resident of the borough he represented.

The statutes of Henry IV. and V. enforced residence as a requisite for electors and elected alike, and that of Henry VI. prescribed that the qualification of both must lie within the shire. The same rule applied to the boroughs. And it was for the most part strictly observed; the members were generally "co-citizens" or *com-burgesses*.
Stubbs, Const. Hist., § 423.

The action of fire on inflammable materials; the act or process of burning. Chemically considered, combustion is a process of rapid oxidation caused by the chemical union of the oxygen of the air, which is the supporter of combustion, with any material which is capable of oxidation—that is, combustible. It results in the formation of oxygen compounds, some or all of which may be gaseous and therefore invisible, and in the liberation of energy, which is made evident by a rise of temperature and often by flame or incandescence. The weight of the products of combustion is always precisely equal to the sum of the weight of the burned substance and that of the oxygen used in the burning. The energy set free is also precisely the same as that which would be required to separate the oxygen again from its combinations. In common life oxygen is the sole supporter of combustion. In the laboratory iodine, chlorin, and some other substances also perform a similar office in certain cases. The term *combustion* has also been applied to slow processes of oxidation not attended by high temperature or evolution of light, such as the combustion in the body which keeps up the animal heat, and the slow decomposition of animal and vegetable matter in the air. See *eremacausis*.

The compression of air renders the *combustion* of gaseous matter less perfect, and, . . . within certain limits at least, the more rarefied the atmosphere in which flame burns, the more complete its *combustion*.
E. Frankland, Exper. in Chem., p. 901.

Any chemical action whatsoever, if its energy rise sufficiently high, may produce the phenomenon of *combustion*, by heating the body to such an extent that it becomes luminous. *Fownes.*

3. In *astrol.*, the state of being combust.

Combustion.—The being within 8° 30′ of the ⊙, which is said to burn up those planets near him, so that they lose their power. It is always an evil testimony.
W. Lilly, Introd. to Astrology, App., p. 339.

Spontaneous combustion, the ignition of a body by the internal development of heat without the action of an external agent. It not infrequently takes place in heaps of rags, wool, or cotton soaked with oil, and in masses of wet coal. In the first case it is caused by the rapid spontaneous oxidation of oil, which raises the temperature sufficiently to make it burst into flame; in the second case a similar rapid oxidation of the sulphur of pyrites contained in coal causes an increase of heat sufficient finally to ignite the coal. See *flame*.

comet (kom'et), *n.* [< ME. *comete,* < AS. *comēta* = F. *comète* = Pr. Sp. Pg. It. *cometa* = D. *komeet* = G. Dan. Sw. *komet,* < L. *cometa,* also *cometes,* < Gr. *κομήτης* (with or without *ἀστήρ,* star), a comet, lit. long-haired (so called from the appearance of its tail), < *κομᾶν,* wear long hair, < *κόμη,* hair: see *coma*^{2}.] **1.** One of a class of celestial bodies which move about the sun in greatly elongated orbits, usually elliptical or parabolic. The typical comet, as it approaches the sun, has the appearance of a bright star-like point (the *nucleus*) surrounded by a mass of misty light (the *coma*), which is extended away from the sun into a stream of light (the *tail*) reaching a length of from 2° to 90°. Comets which follow a parabolic orbit appear but once, their orbit being infinite, and are called *parabolic comets;* those moving in ellipses return periodically, and are called *periodic comets.* The fact of the periodicity of some comets was first established by Halley with reference to the comet of 1682. The paths in which they move are not, like those of the planets, all nearly in the same plane as the orbit of the earth, but are inclined to that orbit at all angles; and their motion along their paths, though generally direct, that is, in the same direction as that of the earth and the other planets, is sometimes retrograde. Some comets have no nucleus; and this is the case with every one while it is still very remote, when it appears as a mere nebulous patch. In this state it is called a *telescopic comet.* As it approaches the sun, the nucleus is gradually formed as a central but not sharply defined point of light; later, the tail, consisting of vaporous matter driven back by some repellent influence of the sun, often with enormous velocity, is formed; and lastly, if the comet is a bright one, a series of bright envelops rise successively from the nucleus, each extending back into the tail, and gradually disappearing. The matter of which comets are composed is so transparent that the faintest stars are seen through them without the slightest diminution of their luster. Of their physical constitution little is definitely known. The most remarkable discovery of recent times regarding them is the identity of the course of some of them with the orbit of certain showers of shooting stars. This was first demonstrated by the Italian astronomer Schiaparelli, who proved the agreement between the orbit of the great comet of 1862 and that of the star-shower seen annually about August 1st–10th. Very remarkable comets appeared in 1456, 1680, 1811, 1841, 1858 (Donati's), 1861, and 1874. They have always been objects of superstitious fear. See cut under *envelop.*

In the navy of the United States (in which the office was first created in 1862) a commodore ranks with a brigadier-general in the army, and may command a division or a squadron, or be chief of staff of a naval force commanded by an admiral or a vice- or rear-admiral; or he may command ships of the first class, or naval stations. In the British navy the rank of commodore is a temporary one, and of two kinds, of which the first conveys authority over a captain in the same ship, while the second does not. The former gives the rank, pay, and allowances of a rear-admiral; the latter, the pay and allowances of a captain. They both carry distinguishing pennants. Abbreviated *Com.*

Also called the *Hellenic dialect,* and distinguished on the one hand from pure Attic, which it approached more or less closely, and on the other from the Alexandrian and other local or Hellenistic dialects. The writings of Aristotle mark the transition from Attic to the common dialect, and Polybius is the earliest writer of note who employs it. Authors who exerted themselves to restore the common dialect as far as possible to the pure Attic standard are called *Atticists.* After the fourth century A. D. the common dialect changed gradually into Byzantine Greek.—**Common diligence.** See *diligence.*—**Common divisor.** See *divisor.*—**Common field.** (Generally in the plural.) The keeping of such a place is a criminal offense. In order to meet various devices to evade the letter of the law, the statutory definitions are usually minute, specifying a great variety of detail. The essential features of all or nearly all laws against common gaming-houses consist in the prohibition of maintaining a place of shelter in any degree accessible to the public, whether open to all who come or only to a select or favored few, as a place of resort for the purpose of gaming. See *gaming.*—**Common good,** in *Scots law,* in its widest sense, all the property of a corporation over which the magistrates have a power of administration solely for behoof of the corporation.—**Common land,** loosely, land owned in severalty but used in common; more strictly, land owned by the community, and, not being appropriated for the time to cultivation by any individual, used as waste or open land for common pasturage. (*b*) More appropriately, the parts of the former system which do not rest for their authority on any subsisting express legislative act; the unwritten law. In this sense common law consists in those principles and rules which are gathered from the reports of adjudged cases, from the opinions of text-writers and commentators, and from popular usage and custom, in contradistinction to statute law. (*c*) More narrowly, that part of the system just defined which was recognized and administered by the king's justices, in contradistinction to the modifications introduced by the chancellors as rules of equity in restraint or enlargement of the customary and statutory law (see *equity*), and, in respect of procedure, in contradistinction to the code practice.—**Common-law procedure acts,** three English statutes of 1852, 1854, and 1860 which simplified the forms of process, pleading, and practice in the superior courts.—**Common long meter,** in *psalmody,* a six-lined stanza combining a common-meter stanza with half of a long-meter stanza: thus, 8, 6, 8, 6, 8, 8. Also called *common hallelujah meter.*—**Common measure.** (*a*) See *common divisor,* under *divisor.* (*b*) In *music,* duple and quadruple rhythm. The usual sign (*A*) for these rhythms is derived from the theory of medieval musicians that duple rhythm was imperfect, and so to be indicated by a half or broken circle (*B*). It is not the initial of the word "common," since originally triple rhythm was regarded as the standard or perfect rhythm. The sign *A* now usually signifies quadruple rhythm, four beats to the measure, while *C* signifies duple rhythm, two beats to the measure. Also called *common time.*—**Common meter,** in *psalmody,* a form of iambic stanza, primarily of 4 lines, having alternately 8 and 6 syllables to the line: so called because it was the commonest stanza in early psalmody. *Double common meter* consists of a stanza with 8 lines having alternately 8 and 6 syllables.—**Common multiple.** See *multiple.*—**Common notion,** a notion applicable to several objects.—**Common nuisance.** See *nuisance.*—**Common particular meter,** in *psalmody,* a stanza with 6 lines, the third and sixth of which have 6 and the rest 8 syllables.—**Common pasturage,** in *Scots law,* a known rural servitude by which the owner of the dominant tenement is entitled to pasture a certain number of cattle on the grass grounds of the servient tenement.—**Common place** [tr. The three estates of clergy, lords, and *commons* finally emerge as the political constituents of the nation, or, in their parliamentary form, as the lords spiritual and temporal and the *commons*. This familiar formula in either shape bears the impress of history. The term *commons* is not in itself an appropriate expression for the third estate; it does not signify primarily the simple freemen, the plebs, but the plebs organised and combined in corporate communities, in a particular way for particular purposes. The *commons* are the "communitates" or "universitates," the organised bodies of freemen of the shires and towns; and the estate of the *commons* is the "communitas communitatum," the general body into which for the purpose of parliament those communities are combined. The term, then, as descriptive of the class of men which is neither noble nor clerical, is drawn from the political vocabulary, and does not represent any primary distinction of class. *Stubbs*, Const. Hist., § 185.

5. The act of partaking of the sacrament of the eucharist; the celebration of the Lord's supper; also, the elements of the eucharist.

Of the several names by which the supper of the Lord has been distinguished, that of the holy *communion* is the one which the Church of England has adopted. *Eden*, Churchman's Theol. Dict., p. 102.

6†. Common action; common consent; public act.

Men . . . served and praised God by *communion* and in public manner. *Raleigh*, Hist. World.

Close communion, among Baptists, communion in the Lord's supper with Baptists only: a practice based on the belief that all who have not received baptism by immersion are in reality unbaptized, and hence not entitled to communion. Those who hold this belief are called *close-communion* Baptists, or *close-communionists*, in distinction from another class of Baptists opposed to it, and hence called *open-communionists*. The former prevail in the United States, and the latter in Great Britain.—**Communion anthem** or **hymn**, an anthem or hymn sung after the canon or prayer of consecration and before or during the communion of priest and people. In the early church, when all the faithful not under discipline communicated as a rule every Sunday, several psalms or hymns with antiphons seem to have been sung at this time. Survivals of this are seen in the Western *communio* and in the *koinonikon* of the Greek Church. The 34th psalm was especially thus used in primitive times, and its eighth verse as an antiphon, "O taste and see," as also in the Mozarabic liturgy. In the Anglican prayer-book of 1549 the Agnus is directed to be sung during the communion of the people. In the American prayer-book a hymn immediately follows the canon.—**Communion elements**, the bread and wine used in the sacrament of the Lord's supper.—**Communion in one kind.** See *half-communion*.—**Communion office**, a liturgical form appointed for the administration of the holy eucharist or Lord's supper.—**Holy communion**, the Lord's supper; the eucharist. After the Reformation this name was substituted for *chalice* in the Protestant churches of England, and the cup was carefully made different in appearance from the old chalice, especially in the form of the bowl, in the absence of the knop, and in having a cover, instead of the paten, fitting the top of the bowl. It is now made in many forms. See cut under *chalice.*

communism (kom'ụ̄-nizm), *n.* [< F. *communisme*, < *commun*, common, + *-isme:* see *common*, *commune*², *n.*, and *-ism.*] 1. An economic system, or theory, which rests upon the total or partial abolition of the right of private property, actual ownership being ascribed to the community as a whole or to the state. The right of the state to control the means of production, and also the distribution and consumption of the products of industry, is in general especially emphasized by the advocates of the theory. In some communistic schemes the right of the individual to the control of his own labor is also denied, each one being required to do that which is most advantageous to the community as a whole. Such theories, differing in details, have frequently been advanced — by Plato in his "Republic," by Sir Thomas More in his "Utopia," and in recent times by many writers — and have not infrequently been carried into execution on a small scale, as in the Oneida Community. See *community.*

Communism, in its ordinary signification, is a system or form of common life in which the right of private or family property is abolished by law, mutual consent, or vow. To this community of goods may be added the disappearance of family life.
Woolsey, Communism and Socialism, p. 1.

Communism is the name that has been given to the schemes of social innovation which have for their starting-point the attempted overthrow of the institution of private property. *Encyc. Brit.*, VI. 211.

All *communists* without exception propose that the people as a whole, or some particular division of the people, as a village, or commune, should own all the means of production — land, houses, factories, railroads, canals, etc.; that production should be carried on in common; and that officers, selected in one way or another, should distribute among the inhabitants the fruits of their labor.
R. T. Ely, French and German Socialism, p. 35.

Discordant theories range from the doctrines of the *communist*, who would overturn our social structures, to those of the timid, half-hearted believers in our government, who wish to go back to restraints and powers exerted by the monarchs of Europe.
N. A. Rev., CXXVII. 360.

With them [the Slavic nations] the rule of the freedom of acquests has been less strictly observed than in other European countries, and with them, accordingly, the *community* continues in its fullest vigor.
W. E. Hearn, Aryan Household, p. 240.

A great many of the manors now or formerly existing represent ancient *communities* in which, little by little, the authority of the *community* was engrossed by the most considerable man in it, until he became the lord, and the other landholders became his dependents.
F. Pollock, Land Laws, p. 41.

4. All other acquisitions during marriage are the joint property of both, and the husband has the active power of disposal during the life of both, the wife's rights being meanwhile passive. On the death of either, the survivor administers, much as in the case of partnership, the survivor being entitled to one half, and the heirs, etc., of the deceased to the other half.—**House community**, an early form of organization in which the heirs of a given ancestor and their heirs in turn continued to live together, upon the common inheritance, with a common dwelling and common table.—**Oneida Community**, a religious society or brotherhood, the *Bible Communists* or *Perfectionists*, established in 1847 on Oneida creek, in Lenox township, Madison county, New York, by John H. Noyes, after unsuccessful attempts to establish it at New Haven, Connecticut, in 1834, and at Putney, Vermont, in 1837. A branch of the Oneida Community also existed at Wallingford, Connecticut, but has now been withdrawn. Originally the Oneida Community was strictly communistic, all property and all children belonging primarily to the society, and the restrictions of marriage being entirely abolished; but in 1879, owing to the increasing demand of public opinion that the social practices of the society should be abandoned, marriage and family life were introduced, and in 1880 communism of property gave place to a joint-stock system, and the Community was legally incorporated as "the Oneida Community, Limited."—**Village community**, an early form of organization, in which the land belonged to the village, the arable land being allotted by it to the members or households of the community, by more or less permanent arrangements, the waste or common land remaining undivided.

Adjectives not admitting this variation, and many adverbs, express like degrees by prefixing the comparative adverbs *more* and *most*: as, *more glorious*, *most glorious*; *more weakly*, *most weakly*; and such phrases often receive, less properly, the same names as the forms of equivalent value.

7. An instrument used to indicate the magnetic meridian, or the direction of objects with reference to that meridian. The mariners' or ship's compass consists of three parts, viz., the *bowl,* the *card,* and the *needle.* The bowl, which contains the card and needle, is usually a hemispherical brass receptacle, suspended by two concentric brass rings (called *gimbals*) in such a manner that the bowl is kept in a horizontal position, notwithstanding the motion of the ship. The circular card is divided into 32 equal parts by lines drawn from the center to the circumference, the points of intersection with the circumference (or the radial lines, or *rhumbs,* themselves) being called the *points of the compass.* The intervals between the points are also divided into halves and quarters. The whole circumference is divided into 360 degrees; consequently, the angle between any two adjoining points is 11° 15′. The four principal divisions (dividing the circumference into four equal parts) are called the *cardinal points,* viz., north, east, south, and west. The names of the others are compounded of these; and if the direction or bearing referred to lies between any two points, quarter or half points are added, as N. E. by E. ½ E.; or it is expressed in degrees, as south 42° west. The needles, of which there are generally from two to four, fastened to the bottom of the card, consist either of laminæ or layers of hardened steel or of bundles of steel wire. In the center of the card is a conical socket poised on an upright pin fixed in the bottom of the bowl, so that the card hanging on the pin turns freely round its center. On shipboard the compass is so fixed that a black mark, called the lubber's line, coincides with an imaginary line parallel to the keel of the ship, and the point of the compass-card which is directly against this line indicates the direction of the ship's head. The indication is, however, subject to a certain modification, owing to the variation of the magnetic meridian (see *variation*) and the deviation of the needle caused by the iron in the ship (see *deviation of the compass,* under *deviation*). The regulation compass in the United States navy, and the one also used on many mail-steamers, is known as Ritchie's liquid compass, in which the card is a skeleton, and the bowl, having a glass top, after being filled with a fluid composed of about one third alcohol and two thirds water, is hermetically sealed.

composing-machine (ko̤m-pō′zing-ma̤-shēn″), *n.* A type-setting machine. The earliest composing-machine, invented by William Church in 1821, attempted to make the types as well as set them. This special and instantaneous making of the types is also the basis of more recent inventions; but most composing-machines are constructed to set types previously made. The types are specially grooved or nicked to fit them for being seized automatically. The arrangement of classified types in separate channels, and their dislodgment in order into a larger channel by means of levers touched from a finger-board, are features common to most composing-machines, widely as they may differ in other details of construction. Few of these machines have come into practical use, owing especially to the difficulty of separating or distributing the types by an automatic process in the special manner required.

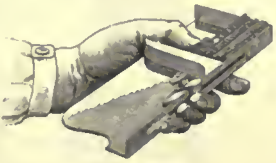
composing-rule (ko̤m-pō′zing-röl), *n.* In *printing*, a thin piece of brass or steel fitted to the composing-stick, on or against which the compositor places and arranges the types. The smooth rule permits the free movement of type in the process of spacing, and it is also used as a support in the act of emptying the stick.

composing-stand (ko̤m-pō′zing-stand), *n.* In *printing*, an elevated framework, usually of wood, on which the type-cases are placed in inclined positions, the part for the upper case having a steeper slope than that for the lower. Also called *composing-frame*, or in common use *frame* or *stand*.



Composing-stick.

composing-stick (ko̤m-pō′zing-stik), *n.* In *printing*, a small tray of iron or other metal, with a raised side and end, which is held by a compositor in his left hand, and in which he places and arranges the types that he picks out of the cases with his right hand. The composing-stick is fitted with a knee, adjustable, by means of a screw or a clamp, to any length of line required in printed work. The earliest composing-sticks were sticks of wood, with knees specially tacked on for different lengths of line; but wooden sticks are now used only in setting hand-bills, or for other work requiring very long lines.

Compositæ^1 (kom-poz′i-tē), *n. pl.* [NL., fem. pl. (sc. L. *plantæ*, plants) of L. *compositus*, composite: see *composite*.] The largest natural order of plants, including over 750 genera and 10,000 species, distributed all over the globe wherever vegetation is found, and divided equally between the old world and the new. They form about a tenth of all phenogamous plants, an eighth of those of North America, and in some regions even a larger proportion. They are herbs, or much more rarely shrubs, scarcely ever arborescent, and are of comparatively slight economic importance. A few species are cultivated for food, as the artichoke (*Cynara*), the salsify (*Tragopogon*), and the lettuce (*Lactuca*); others have useful medicinal properties; and a very large number are cultivated for ornament. The flowers are gamopetalous and mostly pentamerous, sessile in a close head (the compound flower of early botanists, whence the name of the order), and surrounded by an involucre of separate or connate bracts. The ovary is inferior and one-celled, and becomes an achene in fruit, the calyx-limb being reduced to a circle of hairs, awns, scales, or teeth, called the *pappus*. The stamens are inserted on the corolla, and their anthers are united into a tube, on which account the name *Synanthereæ* has been sometimes given to the order. The genera of the order are divided into three series, depending upon the character of the corolla, viz.: (1) the *Labiatæfloræ* (or *Mutisiaceæ*, of 59 genera, largely South American), having a bilabiate corolla, at least in the perfect flowers; (2) the *Liguliflorœ* (or *Cichoriaceæ*, of 56 genera, mostly of the old world), in which the corollas are all ligulate (strap-shaped); and (3) the *Tubulifloræ*, having regular tubular corollas in all the perfect flowers. The last series is again divided into 11 tribes. The 10 largest genera of the order, including three tenths of the species, are *Senecio* (840 species, largely of South America and southern Africa), *Eupatorium* (430 species, all American), *Vernonia* (375 species, mostly tropical), *Centaurea* (316 species, of the Mediterraneo-Persian region), *Baccharis* (250 species, mostly South American), *Helichrysum* (235 species, of southern Africa and Australia), *Aster* (174 species, largely North American), *Cnicus* (165 species, of the Mediterraneo-Persian region and North America), *Artemisia* (152 species, of Europe, Asia, and North America), and *Hieracium* (150 species, of Europe, Asia, and North America). By far the largest North American genus is *Aster* (124 species), followed by *Solidago* (78), *Erigeron* (71), *Senecio* (57), *Aplopappus* (45), *Artemisia* (42), *Helianthus* (42), *Eupatorium* (39), *Cnicus* (37), *Bigelovia* (31), and *Brickellia* (31); these genera include two fifths of the species of North America. Also called *Asteraceæ*.

The negatives from the individuals who are to enter into the composite photograph are so made as to show the faces as nearly as possible of the same size and lighting, and in the same position. These negatives are then printed so as to register together upon the same piece of paper, each being exposed to the light for the same fraction of the full time required for printing. It is believed that by study and comparison of such photographs made from large series of subjects, types of countenance, local, general, etc., can be obtained.—**Composite proof**, in *logic*, one involving several distinct inferences.—**Composite relation**, a relation satisfied if, and only if, some one of the component relations is satisfied. conaria, *n.* Plural of *conarium.*

conarial (kọ̄-nā′ri-a̤l), *a.* [< *conarium* + *-al.*] Of or pertaining to the conarium, or pineal body of the brain.—**Conarial fossa**, a depression of the roof of the skull of some animals, in which the conarium is lodged.—**Conarial tube**, the more or less extended cavity or canal of the pineal body, now commonly supposed to be the remnant of the passage by which in vertebrates generally the primitive cavity of the myelencephalon communicated with the outer surface of the head. In man and the higher vertebrates generally the conarium appears to be deep-seated in the brain; but this is deceptive, and merely owing to the overgrowth of the cerebrum. The conarium is morphologically on the superior surface of the brain, whatever its apparent situation, and there is much reason to suppose that the large openings of the top of the skull in sundry Tertiary mammals, called the parietal foramina, indicate the extension of the conarial tube to the surface, and the formation there of a visual or other special-sense organ. On this view, the conarium is the vestige of an extinct eye. See *conarium.*

=**Syn.** *Concise, Succinct, Condensed, Laconic, Summary, Compendious*, short, terse, pithy, sententious, compact. The first four imply fullness of meaning as well as great brevity; the next two that the subject is treated by exhibiting only its main heads, and that therefore the treatment is comparatively brief. *Concise* frequently refers to style, and signifies the expression of much in few words; *succinct* is generally applied to the matter, the less important things being omitted: thus, a *concise* style or phrase, but a *succinct* narrative or account. *Condensed* relates more to the mode of treatment by which a matter is brought or compressed into a smaller space than it might have occupied. *Laconic* is applied to expressions which carry conciseness or brevity to an extreme. A *summary* account gives the principal points in the case; a *compendious* account is more sure than a *summary* account to give a complete and sufficient view of the subject.

Concords of two tones (also called *consonances*) are either *perfect* or *imperfect;* perfect concords include primes, fourths, fifths, and octaves, and imperfect include major and minor thirds and major and minor sixths. Concords of more than two tones contain only the above intervals between every pair of their constituent tones; but the triad, consisting of the 2d, 4th, and 7th of the scale when the 2d is in the lowest voice, is ranked as a concord, notwithstanding the dissonance between the 4th and 7th. (See *triad*, and *common chord*, under *chord*, 4.) Concords of two tones are acoustically distinguished from discords by the simplicity of the ratios between the vibration-numbers of the tones: thus, the ratios of the above concords are $\frac{1}{1}$, $\frac{1}{2}$, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{4}{5}$, $\frac{5}{6}$, $\frac{3}{5}$, and $\frac{5}{8}$ respectively. Specifically—(*a*) Any device for reducing gases or vapors to liquid or solid form. The reduction is usually effected by lowering the temperature of the vapor by contact with chilled surfaces. A form of condenser common in the laboratory is shown in the figure. From the flask, *A*, the vapor to be condensed escapes through the tube *b c*, which passes through a larger condenser-tube. A stream of ice-water enters the condenser through *d*, and passes off through *g*, keeping the surface of the inner tube, *b c*, chilled, and the vapor entering the tube from *A* is condensed and drops from *c* as a liquid. Condensers used to concentrate vapors or gases, as steam, alcoholic vapors, fumes, volatile liquids, etc., commonly depend upon the reducing effects of a lower temperature. In them the vapor, gas, smoke, or fumes are brought into immediate contact with chilled surfaces. This is accomplished in a great variety of ways, as in the surface condenser of the steam-engine, the worm of a still, or the long convoluted tubes in which poisonous fumes or smoke are cooled before being allowed to escape to the chimney. The cooling surfaces are usually kept cold by water, as in the still, the gas-condenser, the sugar-condenser, etc. For fumes and smoke, the contact with walls exposed to the air is sufficient. (*b*) A part of a cotton-gin which compresses the lint for convenient handling. (*c*) In *wool-manuf.*, a machine which forms the wool received from the doffer of a carding-engine or comber, and rolls it into slubbings. The doffer of the carding-engine is covered by a series of parallel strips of card-clothing, wrapped about the cylinder. The wool thus comes off in a number of loose flat ribbons of fleece, which in the condensing-machine are carried by a leather apron beneath a roller which has a reciprocating motion transverse to their direction, and thus rolls these slivers into loose slubbings, which are wound upon a roll and are ready for spinning. (*d*) In the manufacture of sugar, the apparatus used for concentrating the clarified juice, preparatory to its final concentration in the vacuum or evaporating-pan. The liquor trickles over the surface of steam-pipes, where heat evaporates the water which constitutes the greater part of the cane-juice. (*e*) In optical instruments, a lens, or combination of lenses, used to gather and concentrate the rays of light collected by a mirror and direct them upon the object, as the bull's-eye condenser (see *bull's-eye*, 9) and the achromatic condenser used with the microscope.—**Achromatic condenser.** See *achromatic*.—**Condenser hygrometer**, a dew-point hygrometer. See *hygrometer*.—**Condenser of electricity**, any apparatus by which electricity can be accumulated, usually consisting of two conducting surfaces separated by a non-conductor, as in the condenser of Epinus (see figure), which is charged by connecting one of the plates (*A*) with the electrical machine and the other (*B*) with the ground; their distance from the glass plate (*C*) can be adjusted at will. A practical form of condenser is the Leyden jar (which see, under *jar*). Condensers are much used in connection with submarine telegraphy; one of the Atlantic cables has a condenser with over two acres of surface of tin-foil, arranged in plates separated by waxed paper and paraffin. The term is also applied to such instruments as are employed to collect and render sensible very small quantities of electricity, as the condensing electroscope. See *electroscope*.—**Hydraulic condenser.** See *hydraulic*.—**Surface condenser**, in a steam-engine, a condenser in which the exhaust-steam is distributed through a large number of pipes surrounded by cold water, which is constantly renewed. In a less common form flat chambers are used instead of pipes.

The Scotists maintain that it is possible for man in his natural state so to live as to deserve the Grace of God, by which he may be enabled to obtain salvation, this natural fitness (congruitas) for grace being such as to oblige the Deity to grant it. Such is the merit of congruity. The Thomists, on the other hand, contend that man, by the divine assistance, is capable of so living as to merit eternal life, to be worthy (condignus) of it in the sight of God. In this hypothesis, the question of previous preparation for the grace which enables him to be worthy is not introduced. This is the merit of *condignity*." *Hook*, Eccles. Dict.

condor (kon′dor), *n.* [= D. G. Sw. *condor* = Dan. *kondor* = F. *condor*, formerly *condore* = It. *condore*, < Sp. Pg. *condor*, < Peruv. *cuntur*, a condor.] 1. A very large South American bird of prey, *Sarcorhamphus gryphus*, of the family *Cathartidæ* or American vultures, having the head and upper part of the neck naked and largely caruneulate, an exposed ruff of downy white feathers round the neck, and the general plumage blackish, varied with much white in the wings. The size of the condor has been greatly exaggerated; it is not known to exceed 9 feet in stretch of wings, and is little over 3 feet in total length. The bird inhabits chiefly the Andean regions, at elevations of from 10,000 to 15,000 feet above the sea, where it breeds, making no nest, but laying its eggs on the bare rocks. Condors are never seen in large companies, but in groups of three or four, and descend to the plain only when impelled by hunger. At such times two of them will successfully attack sheep, goats, deer, etc., though as a rule they prefer carrion.
2. A South American gold coin. That of Ecuador and Colombia is worth $9.647; that of Chili, $9.123.—**California condor**, the large vulture of California, *Cathartes* or *Pseudogryphus californianus*, resembling the Andean condor and fully as large, with the head and beak differently shaped and not caruneulate, no downy collar, much less white on the wings, and the plumage of the breast of peculiar texture.

3. It is distinguished from convection, by which heat and electricity are carried by moving particles; from the radiation of heat, which does not raise the temperature of the intermediate points (except so far as the radiation is hindered); and from the discharge and the electrolytic transfer of electricity.

> *Conduction* [of heat] is the flow of heat through an unequally heated body from places of higher to places of lower temperature. *Clerk Maxwell*, Heat, p. 10.

conductivity (kon-duk-tiv′i̤-ti), *n.* [< *conductive* + *-ity*.] In *physics*, the power of conducting heat, electricity, or sound; the property of being conductive. In the case of heat (thermal conductivity) solids have in general a much higher degree of conductivity than liquids, and liquids than gases, the last being practically destitute of conductive power; both liquids and gases become heated by convection (which see), not by conduction. Furthermore, among solids the conductivity of metals for heat is greater than that of stony bodies, that of animal and vegetable substances being the least of all. Metals have also a relatively high degree of conductivity for electricity, a charge of electricity distributing itself freely over a metallic surface, and an electrical current passing more or less readily through a metallic wire. These metals which are the best conductors of heat, as silver, copper, and gold, are also the best electrical conductors. The conductivity of many solids (glass, sulphur, resin) is nearly zero for electricity; the same is true to a less degree of most liquids and also of gases. With any substance the conductivity for electricity is the reciprocal of the resistance. See *resistance*.

> *Conductivity* varies not only with varying temperature, but also with varying tension, torsion, or pressure.
> *A. Daniell*, Prin. of Physics, p. 564.

> Péclet . . . employs as the unit of *conductivity* the transmission, in one second, through a plate a metre square and a millimetre thick, of as much heat as will raise a cubic decimetre (strictly a kilogramme) of water one degree.

The type is the white-backed skunk or conepatl, found in Texas, Mexico, and southward; there are probably other species. Also called *Thiosmus*.

Conepatl (*Conepatus mapurito*).

> *Conepatus* is obviously the same as the old Mexican conepatl; . . . it probably refers to the burrowing of the animal; for it may be observed, nepantla in the Nahuatl language signified a subterranean dwelling. *Coues*, Fur-bearing Animals (1877), p. 249.

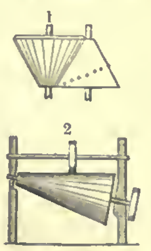
cone-valve (kōn′valv), *n.* A valve with a conical face and seat.

cone-wheel (kōn′hwēl), *n.* A cone, or frustum of a cone, used as a means of transmitting power. A very common method of obtaining a change of speed is to use two cones with parallel axes, but with their bases in opposite directions, and connected by a belt moved at will by a shifter. When the belt is at the middle of the cones, supposing the two to be of equal size, the working diameters are equal, and the motion of the driver and driven is uniform. By shifting the belt to either side the relative speed of the driven cone may be increased or diminished. An intermittent or any irregular motion may be given by teeth placed in various positions upon the surfaces of the two cones, and so as to engage each other. See *cone-pulley*.



Cone-wheels.

In fig. 1 two frustums are in apposition, one having teeth on its face and the other a spirally arranged row of studs. The frustum in fig. 2 when driven by the motor communicates motion to the wheel above it.

Confederate States of America, the name assumed by the southern States which seceded from the American Union in 1860–61, on the occasion of the election of a President (Abraham Lincoln) and Congress unfriendly to the institution of slavery, and formed a government under a constitution adopted by a general convention at Montgomery, Alabama, on March 11th, 1861. The confederation ultimately consisted of the following eleven States, which adopted ordinances of secession in the order given, the first on December 20th, 1860, and the last on May 20th, 1861: South Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, Texas, Virginia, Arkansas, Tennessee, North Carolina. They were readmitted to their former status as equal members of the United States after a little more than four years of civil war (the first actual hostilities occurring at Fort Sumter in South Carolina on April 12th, 1861, and the last in Texas on May 13th, 1865), and after a period of reconstruction and the acceptance of certain amendments to the federal Constitution, one of which abolished slavery. Abbreviated *C. S. A.*

> *Woolsey*, Introd. to Inter. Law, § 104.

Articles of Confederation, in *U. S. hist.*, the compact or constitution adopted by the Continental Congress in 1777 and ratified by the separate colonies within the next four years. The government formed under this compact, which went into effect on March 1st, 1781, was without an executive and judiciary, consisting simply of a congress of one house, in which each State had one vote; it was empowered to declare war and peace, make treaties with foreign powers, direct the land and naval forces in time of war, make requisitions upon the separate States for their quota of the money necessary for national expenses, regulate the value of coin, control the postal service, etc. As it had no power to enforce its laws upon the States, it soon fell into contempt, and on March 4th, 1789, expired by limitation under the provisions of the present Constitution.—**New England Confederation**, the union effected by the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven in 1643, suggested by the need of a common defense against the Dutch and the Indians. It was discontinued in 1684.=**Syn.** *Confederation*, *Confederacy*, *Federation*. A *confederation* or *confederacy* is sometimes distinguished from a *federation* as follows: Both designate a union of distinct states. In a *federation*, however, the essential sovereignty, as exercised toward foreign countries, is regarded as irrevocably deposited in the hands of the central government, and only a constitutionally limited autonomy in internal matters is retained by the constituent territories; while in a *confederation* the sovereignty may be conceived as still existing in the constituents and exercised more or less extensively by the general government as delegated agent: a *confederacy* is regarded as even less permanent than a *confederation*. Thus, the union of the thirteen colonies before 1789 was a *confederation*, while the United States since that time have constituted a *federation*. The above distinction, however, is not strictly adhered to in the ordinary use of these words.

It was conducted on three days (January 14th, 16th, and 18th), and resulted in a few alterations of the liturgy, but entirely failed to secure the objects sought by the Puritans. An important indirect result of it was the revision of the Bible called the King James or authorized version, which was suggested at that time.—**Savoy Conference**, a conference held at the Savoy palace in London, after the restoration of Charles II. 4. [ML. *confessio(n-)*.] The tomb of a martyr or confessor. If an altar was erected over the grave, the name was extended also to the altar and to the subterranean chamber in which it stood. In later times a basilica was sometimes erected over the chamber; the high altar was placed over the altar on the tomb below, and so this high altar also, and subsequently the entire building, was called a *confession*. Also called *confessional*, and in the Greek Church *catabasis* or *catabasion*.—**Auricular confession.** See *sacramental confession*, below.—**Confession and avoidance,** in *law*, the substance of a pleading by which the party admits the allegation of his adversary's pleading to be true, but states some new matter by way of avoiding its legal effect.—**Confession of faith.** See 3, above.—**Confession of judgment,** the acknowledgment of a debt by a debtor before a court or a justice of the peace, etc., on which judgment may be entered and execution issued.—**General confession.** (*a*) A confession made to a priest of sins committed by the penitent since baptism or since infancy, so far as those sins can be remembered; a confession made in preparation for baptism by one baptized after coming to years of discretion, also before admission to a monastic order. (2) The form of confession in the Communion office.—**Judgment by confession,** a judgment obtained on a confession made to a court or a magistrate, or by the withdrawal of the defense, or against a plaintiff by nolle prosequi.—**Sacramental** or **auricular confession,** the act or practice of confessing sins to a priest, for the purpose of receiving absolution. At a very early period, for gross apostasy or other public sins, public confession was required as a condition precedent to partaking of the communion. Public confession was gradually abolished in order to prevent scandal and social and legal complications. Auricular confession was first made universally obligatory in the West as a condition of admission to communion by the fourth Lateran Council in A. D. 1215. It is now required in the Roman Catholic Church from all who are conscious of mortal sins, and is regarded as essential to absolution and divine pardon, and a necessary prerequisite to partaking of the communion. Priests are bound in the strongest manner never to disclose a secret thus confided to them. Confession is obligatory in the Orthodox Greek and in the Armenian Church. The Anglican Church differs from the Roman Catholic and the Eastern Church in not making it obligatory, but leaving it to the conscience of the individual.—**Seal of confession,** in the *Rom. Cath.* and in the *Gr. Ch.*, absolute secrecy incumbent on a priest with regard to all private confessions of sins made to him. A similar secrecy is enjoined by the 113th canon of the Church of England. Also called *the seal*, and the *sacramental seal*.

In regard to opinion or belief it may mean no more than *sure*, or it may suggest reliance, as on one's own judgment or upon evidence: as, a *confident* expectation, hope, belief. (For *dogmatic*, see *magisterial.*) That *confident* and *positive* depend somewhat upon the will, and not merely, like *sure* and *certain*, upon the understanding, is shown by the fact that it is not correct to say "I will not be *certain*, or *sure*, about this," while it is correct to say "I will not be *positive*, or *confident*, about it."

(*e*) *Eccles.*: (1) A rite whereby baptized persons are admitted to full communion with the church. In the Roman Catholic, Greek, and Anglican churches it consists of the imposition of hands and prayer by a bishop (or in the Greek Church by episcopal authority), preceded in the two former by unction or anointing with chrism. In the first two churches it is regarded as the confirming or strengthening of the grace given in baptism and the bestowal of the gifts of the Spirit. In the Anglican Church, high-churchmen and low-churchmen regard it from different points of view, the latter attaching especial importance to the personal renewal made in it, by the persons confirmed, of the vows taken by others in their name at baptism, while the former believe it to be essentially a sacramental rite, conveying the strengthening power of the Holy Ghost. This rite is believed to be recorded in the New Testament as a laying on of hands following baptism, distinct from ordination, and administered by apostles only. Unction was discontinued in the Anglican Church not long after the Reformation. In the early church confirmation immediately followed baptism, and the Greek Church has always retained this practice; in the West, however, the two have been separated since the thirteenth century by an interval of seven years or more. Formerly confirmation was sometimes allowed to be administered by presbyters if authorized by the bishop; and this is still the case in the Greek Church, where it is administered by priests with chrism consecrated by a bishop. Confirmation is one of the seven great religious rites, distinctively called *sacraments* by the Roman Catholic Church, and *sacraments* or *mysteries* by the Greek. The Anglican formularies mention it as one of "five commonly called sacraments," but do not place these in the same rank with baptism and the Lord's supper as sacraments "ordained of Christ our Lord in the Gospel." (See *sacrament.*) In the Lutheran and Reformed churches the rite is administered by the pastors. Other Protestant denominations reject it.

The Fathers . . . held *confirmation* as an ordinance apostolic always profitable in God's Church. *Hooker*, Eccles. Polity, v. 66.

Erected or maintained in honor of Confucius: as, a *Confucian* temple.

Confucianism (kọn-fū'shiạn-izm), *n.* [< *Confucian* + *-ism.*] Properly, the ethico-political system taught by Confucius. He sought (unsuccessfully) to remedy the degeneracy and oppressions of his time, and to secure peace and prosperity to the empire, by the spread of learning and the inculcation of virtue, setting up as models to be imitated the "ancient kings" Yao and Shun (about 2356–2204 B. C.), who, by their virtue and the force of their individual character, were said to have removed evil, poverty, and ignorance from the empire. The system of Confucius was essentially mundane in its methods and aims, being based upon the proper discharge of the duties involved in the five relationships of life, namely, those of prince and subject, parent and child, brother and brother, husband and wife, and friend and friend. By many Confucianism is called one of the three religions of China, the others being Taoism and Buddhism. In this sense the term includes both the Confucian scheme of ethics and statecraft and the ancient native religion (for which the name *Sinism* has been proposed) existent in China from the dawn of Chinese history, and still observed as the state religion. Its chief features are: (1) the worship of the Supreme Being (Shang-ti) by the emperor on behalf of the people; (2) the worship of "the host of spirits," as the gods of the winds, of the rivers, of the mountains, the grain, etc., by the officials and dignitaries; and (3) the observance of ancestral worship and filial piety by all. (See *Sinism.*) By others the term has been still further extended, so as to include the cosmogonic speculations of Chu-hi and the other speculative philosophers of the twelfth century. The only Chinese term corresponding in any degree to the word *Confucianism* is *Yu-Kiao*, 'the system of the learned.'

Confucianism pure and simple is in our opinion no religion at all. The essence of *Confucianism* is an antiquarian adherence to traditional forms of etiquette — taking the place of ethics; a sceptic denial of any relation between man and a living God — taking the place of religion; while there is encouraged a sort of worship of human genius, combined with a set of despotic political theories. But who can honestly call this a religion? *China Rev.*, VIII. 59.

I use the term *Confucianism* . . . as covering, first of all, the ancient religion of China, and then the views of the great philosopher himself, in illustration or modification of it. *J. Legge*, Religions of China, p. 4.

Ch.*: (*a*) One of the committees of cardinals appointed by the pope to aid him in the transaction of the business of the church. The decisions of these congregations are ordinarily regarded as equivalent to decisions of the pope himself. There are eleven regular congregations, namely: (1) the *Congregation of the Consistory*, which prepares the business to be brought before the consistory or assembly of all the cardinals (see *consistory*, 4); (2) the *Congregation of the Holy Office of the Inquisition*, which tries all cases of heresy brought before it, and formerly heard appeals from lower inquisitorial courts, and sent inquisitors where needed (see *inquisition*); (3) the *Congregation of the Index*, which decides what books shall be placed upon the Index Expurgatorius, or list of forbidden books (see *index*); (4) the *Congregation of Rites*, whose duty is to promote a general uniformity of the externals of divine worship, and to decide with regard to the beatification and canonization of any one whose name is proposed therefor; (5) the *Congregation of Immunities*, which is charged with the duty of determining all matters concerning the right of asylum, and such as relate to ecclesiastical jurisdiction where it comes in contact with the civil power; (6) the *Congregation of the Fabric*, which is charged with everything that relates to the conservation of St. Peter's; (7) the *Congregation of the Council* (that is, of Trent), which is the official interpreter of the decrees of the Council of Trent on all matters of discipline whenever questions arise thereon, the interpretation of its articles of faith being reserved to the pope himself; (8) the *Congregation of Bishops and Regulars*, which disposes of such differences as may arise between the bishops and the regular communities within their respective dioceses; (9) the *Congregation of Discipline*, which superintends the interior discipline of monastic establishments; (10) the *Congregation of the Propaganda*, which has charge of the missions of the church, and of the College of Propaganda, an institution at Rome for the instruction of men intended for missionary work (see *propaganda*); (11) the *Congregation of Indulgences*, which superintends the examination and certification of the authenticity of relics and the grant of indulgences. Other special congregations are also appointed by the pope. *Cath. Dict.* (*b*) A religious community bound together by a common rule, but not by the solemn and irrevocable vows which characterize the monastic orders. Among them are the Oratorians, the Dames Anglaises, the Fathers of the Mission or Lazarists, the Oblates, the Passionists, the Redemptorists, the Marists, and the Christian Brothers. (See *Christian Brothers*, under *Christian*^{1}.) (*e*) A group of monasteries which agree to practise the rules of their order more strictly in their respective houses, and unite themselves together by closer ties, such as the congregations of Cluny and St. Maur.

As a broad general rule, nearly every post-Reformation institute is styled, not an "Order," but a "*Congregation*"; but the only distinction which can be drawn between these two names is that "order" is the wider, and may include several *congregations* within itself (as the Benedictine order, for example, includes the *congregations* of Cluny and of St. Maur), while a *congregation* is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.

Encyc. Brit., XVI. 715.

(*d*) A committee of bishops appointed by the pope, or with his approbation, to prepare rules of business, etc., for a general council. In the General Council of Constance the congregation was differently constituted, the Council being divided into congregations according to the nationalities represented—German, French, Italian, English, and subsequently Spanish. These voted separately, preliminary to the final action of the Council as a whole.

Congregation of loci, a collection of loci to one or other of which the point or other element is restricted. They denied the authority of the Bible and the truth of important Christian doctrines, and some of them also the existence of a personal Deity. As they became politically powerful, they were suppressed in Saxony and Bavaria, and continued to exist in Prussia only under great difficulties. There are some of these congregations in the United States.—**Lords of the Congregation**, in *Scot. ch. hist.*, a title given to the chief nobles and gentlemen who signed the Covenant of December 3d, 1557, for liberty of worship. The whole body of adherents was called *the Congregation*, from the frequent recurrence of the word *congregation* in the document.=**Syn. 4.** See *spectator*.

congregationalism (kong-grē-gā'shọn-al-izm), *n.* [< *congregational* + *-ism.*] **1.** A system of church government based upon the autonomy of the individual congregation. It embodies three fundamental principles—(1) that it is the right and duty of believers in Jesus Christ in every community to organize for Christian work and worship, and that such an organization is a Christian church; (2) that each such church is by right independent of all external ecclesiastical control, and in any such church all members possess equal ecclesiastical authority; (3) that such churches owe a duty of Christian fellowship and coöperation to one another. This fellowship and coöperation is exercised among those who bear the name of Congregationalists by means of councils, conferences, consociations, and associations. The principles of congregationalism are maintained not only by Congregationalists so called, but also by Baptists, Unitarians, Universalists, and some other denominations of Christians, and by many evangelical churches in France, Switzerland, etc.

Congregationalism is the democratic form of church order and government; it derives its name from the prominence which it gives to the congregation of Christian believers. It vests all ecclesiastical power (under Christ) in the associated brotherhood of each local church, as an independent body. At the same time it recognizes a fraternal and equal fellowship between these independent churches, which invests each with the right and duty of advice and reproof, and even of the public withdrawal of that fellowship in case the course pursued by another of the sisterhood should demand such action for the preservation of its own purity and consistency. Herein *Congregationalism* as a system differs from Independency, which affirms the seat of ecclesiastical power to reside in the brotherhood so zealously as to ignore any check, even of advice, upon its action.

H. M. Dexter, Congregationalism (2d ed.), i.

2. [*cap.*] The system of ecclesiastical polity and religious doctrine maintained by the Congregational Church. See *congregationalist*, 2.

congregationalist (kong-grē-gā'shọn-al-ist), *n.* [< *congregational* + *-ist.*] **1.** One who holds to the congregational principles of church government. See *congregationalism*, 1. In this sense, Baptists, Unitarians, Universalists, some Methodists, and some other denominations of Christians are congregationalists. **2.** [*cap.*] One of a denomination of Christians who hold to the congregational principle of church government, to the system of doctrines known as evangelical or orthodox, to the legitimacy of the baptism of infants, and to baptism by sprinkling. The Congregationalists of the United States are identical in origin and general principles with the Independents (now also called *Congregationalists*) of Great Britain. They were the predominant religious body in the first settlement of New England, and have thence spread over the United States, especially in the Northern and Middle States. Their churches are independent of one another; their various ecclesiastical assemblies—councils, conferences, consociations, associations—possess no ecclesiastical authority, but only a moral power; and they are generally moderate Calvinists in theological doctrines. Their missionary operations are carried on by means of voluntary societies supported by the churches, but only indirectly amenable to them.

2. The meeting of persons in sexual commerce.—**3.** A formal meeting or association of persons having a representative character; an organization or authorized assemblage of persons for the consideration of some special subject or the promotion of some common interest; particularly, in *politics*, an assemblage of envoys, commissioners, or plenipotentiaries representing sovereign powers, or of sovereigns themselves, for the purpose of arranging international affairs: as, the *Congress* of Vienna (1814–15); the *Congress* of Paris (1856). For the distinction between *conference* and *congress*, see extract under *conference*, 2 (*a*).

4. [*cap.*] The national legislature of the United States. In *U. S. hist.* there have been three differently constituted bodies so named: (*a*) The *Continental Congress*, representing the thirteen colonies. What is known as the first Continental Congress, with delegates from all the colonies but Georgia, met in Philadelphia September 5th, 1774, and lasted until October 26th, 1774; the second, in which all were represented, met in Philadelphia May 10th, 1775, and adjourned December 12th, 1776; the third met in Baltimore December 20th, 1776, and lasted until the Articles of Confederation went into operation, March 1st, 1781. (*b*) The *Congress of the Confederation*, representing the States under the Articles of Confederation, March 1st, 1781, to March 4th, 1789. (*c*) The *Congress of the United States*, which represents both the States and the people under the Constitution, and which met for the first time March 4th, 1789. It consists of two houses, the Senate and House of Representatives (sometimes called the upper and lower houses), and meets at least once every year. The Senate is composed of two members from each State, elected (by its legislature) for a period of six years, one third of them being elected every second year. The number of representatives varies in each State in proportion to the population. (See *apportionment*, 2.) They sit for two years only. The united body, for the two years during which the representatives hold their seats, receives a numerical designation as a single Congress, counting from the first. Thus, the senators and representatives sitting during the period March 4th, 1887, to March 4th, 1889, constituted the 50th Congress. The most important powers of Congress, as enumerated in the Constitution, are: to impose and collect taxes, borrow and coin money, regulate commerce, establish uniform naturalization and bankruptcy laws, declare war, raise armies, maintain a navy, suspend the writ of habeas corpus, admit new States, and make all laws necessary to carry these powers into execution. In addition, the Senate confirms or rejects treaties, and nominations to office made by the President.

The substitution of "*Congress*" for "the legislature of the United States," requires no explanation. It is a mere change of phraseology.

Calhoun, Works, I. 256.

The upper house of *Congress* is therefore a federal while the lower is a national body, and the government is brought into direct contact with the people without endangering the equal rights of the several states.

J. Fiske, Amer. Pol. Ideas, p. 97.

5. The name of the lower house of the Spanish Cortes, and of the national legislatures of the South American republics.—**Church Congress**, a name applied to two voluntary organizations, one in the Church of England, the other in the Protestant Episcopal Church in the United States of America, for the free discussion of topics of church interest. Membership is confined to those who are in communion with the church. Neither body possesses any ecclesiastical authority or responsibility, or attempts any legislative functions. The same name, with modifying adjectives, as *Inter-ecclesiastical Congress, Inter-denominational Congress*, etc., has been applied to other bodies of a similar character embracing members of various Protestant communions.—**Congress boots.** See *boot*^{2}.—**Congress water.** See *mineral water*, under *mineral*.—**Peace Congress**, in *U. S. hist.*, a conference, in February, 1861, of delegates from free and border slave States, which made unsuccessful efforts to avert civil war by means of proposed amendments to the Constitution, dealing chiefly with slavery. Also called *Peace Convention* or *Conference*.—**Provincial congresses**, popular conventions which, at the beginning of the struggle between the American colonies and England, assumed control of the colonies.—**Stamp-Act Congress**, a body of delegates from nine colonies which met at New York, in 1765, to protest against the Stamp Act and other oppressive measures of the British Parliament.

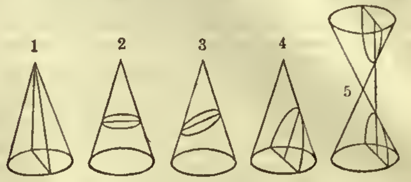
Prior, Solomon, i.

2. Specifically, in *math.*, of or pertaining to a cone: as, *conic* sections.—**Conic section** [NL. *sectio conica*, Gr. *κωνικὴ τομή*], a curve formed by the intersection of a plane with a right circular cone. If the plane is more inclined to the axis of the cone than is the side of the cone (fig. 3), the intersection is oval and is called an *ellipse*. The circle is one limit of the ellipse—that, namely, in which the plane becomes perpendicular to the axis of the cone. If the plane is less inclined to the axis of the cone than is the side of the cone, it will also cut the second sheet of the cone on the other side of the vertex (fig. 5), and the twofold curve thus generated is a *hyperbola*. A particular case of the hyperbola, produced when the plane passes through the vertex of the cone, is that of two intersecting straight lines, called a *degenerate conic*. Intermediate between the ellipse and the hyperbola is the case where the plane is parallel to the side of the cone (fig. 4), and the curve thus produced is a *parabola*. The degenerate form of the ellipse is a point, that of the parabola a straight line. The degenerate forms are not true conics, because they are of the first class, the conics being of the second class.—**Spherical conic section**, a curve produced by the intersection of a sphere with a cone.



Conic Sections.

The two principal forms are fig. 5, giving the hyperbola, and fig. 3, giving the ellipse. Fig. 4 is the intermediate case, giving the parabola. The degenerate form of the hyperbola is a pair of straight lines, as shown in fig. 1. Fig. 2 shows the circle as a special case of the ellipse having no special relations to the infinitely distant part of the real plane, though it passes through two fixed imaginary points on the line at infinity.

Dr. H. More, Def. of Lit. Cabbala, i.

Conical bearing. See *bearing*.—**Conical gearing.** See *gearing*.—**Conical map-projection**, the projection of the earth first upon a tangent or secant cone with the subsequent development of the cone. The best-known conical projection is Bonne's, used for the map of France. "In constructing a map on this projection, a central meridian and a central parallel are first assumed. A cone, tangent along the central parallel, is then assumed, and the central meridian developed along that generator of the cone which is tangent to it, and the cone is then developed on a tangent plane. The parallel falls into an arc of a circle with its center at the vertex, and the meridian becomes a graduated right line. Concentric circles are then conceived to be traced through points of this meridian at elementary distances along its length. The zones of the sphere lying between the parallels through these points are next conceived to be developed, each between its corresponding parallels. Thus all the parallel zones of the sphere are rolled out on a plane in their true relations to each other and to the central meridian, each having in projection the same width, length, and relation to the neighboring zones as on the spheroidal surface. As there are no openings between consecutive developed elements, the total area is unaltered by the development. Each meridian of the projection is so traced as to cut each parallel in the same point in which it intersected it on the sphere." *Craig*, Treatise on Projections, p. 72.—**Conical point**, in *geom.*, a point on a surface such that every line through it meets the surface in two coincident points.—**Conical pupæ** or **chrysalides**, in *entom.*, those pupæ or chrysalides which have no angular processes, and are more or less conical in form. This is the common type among nocturnal *Lepidoptera*.—**Conical refraction.** See *refraction*.—**Conical surface**, any surface generated by the motion of a right line having one point fixed.—**Conical valve**, the puppet-valve or T-valve, first used by Watt in the construction of his engines. It consists of a circular plate of metal having a beveled edge accurately fitted to a seat.

It consists of trees or shrubs, mostly evergreen and resinous, usually with subulate (awl-shaped), needle-shaped, or scale-like rigid leaves, and with monœcious or rarely diœcious naked flowers. The male flower consists of an indefinite number of stamens upon a central axis, the anthers being frequently suspended from the under side of a peltate scale. The fertile ament consists of scales bearing naked ovules, and in fruit becomes a dry cone or is fleshy and drupe-like. The embryo has often several cotyledons in a whorl. The wood, as in all gymnosperms, is characterized by having the sides of the cells dotted with what are called bordered pits or discoid markings. The order includes 32 genera and about 300 species, and is divided into the following tribes: (*a*) *Abietineæ*, bearing cones formed of spirally imbricated two-seeded scales; to this belong the pine, fir, spruce, larch, cedar, etc. (*b*) *Araucarieæ*, with similar cones having one or several seeds to each scale, represented by *Araucaria* and *Agathis* in the southern hemisphere, and by two monotypical genera in China and Japan. (*c*) *Podocarpeæ*, likewise of the southern hemisphere and eastern Asia. (*d*) *Taxodineæ*, including the big-tree of California (*Sequoia*), the bald cypress (*Taxodium*), and a few species of Australia and Japan. (*e*) *Cupressineæ*, having cones with decussately opposite scales, or sometimes drupe-like, as the cypress, juniper, arbor-vitæ, and the North American cedars. (*f*) *Taxeæ*, with fruit consisting usually of a single seed surrounded by a fleshy disk or coat. This tribe is by some considered a separate order, and includes the yew (*Taxus*), *Torreya*, the ginkgo of China, and some other small genera of Australia and Australasia. True conifers first appear in the Carboniferous measures, and continue upward through all subsequent formations.

=**Syn.** *Imagine, Conjecture, Surmise, Guess, Presume*, fancy, divine. *Imagine* literally expresses pure speculation, and figuratively expresses an idea founded upon the slightest evidence: as, I *imagine* that you will find yourself mistaken. *Conjecture* is something like a random throw of the mind; it turns from one possibility to another, and perhaps selects one, almost arbitrarily. *Surmise* has often the same sense as *conjecture*; it sometimes implies a suspicion, favorable or otherwise: as, I *surmise* that his motives were not good. *Guess* suggests a riddle, the solution of which is felt after by the mind—a question, as to which we offer an opinion, but not with confidence, because the material for a judgment is confessedly insufficient. To *presume* is to base a tentative or provisional opinion on such knowledge as one has, to be held until it is modified or overthrown by further information.

The sylphs through mystic mazes guide their way.

Aristotle . . . inquireth the nature of a commonwealth, first in a family, and the simple *conjugations* of man and wife, parent and child, master and servant.
Bacon, Advancement of Learning, ii. 124.

I intended it to do honour to christianity, and to represent it to be the best religion in the world, and the *conjugation* of all excellent things.
Jer. Taylor, Works (ed. 1835), I., Pref.

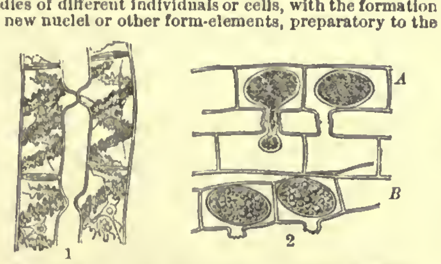
2. In *gram.*: (*a*) The inflection of a verb in its different forms, as voices, moods, tenses, numbers, and persons; a connected scheme of all the derivative forms of a verb. (*b*) A class of verbs similarly conjugated: as, Latin verbs of the third *conjugation*. (*c*) In Hebrew and other Semitic languages, one of several groups of inflections normally formed from the same verb, and expressing a modification of meaning analogous to that found in certain classes of derivative verbs in Indo-European languages, or to the voices of these. [The Latin *conjugatio* is a translation of the Greek *συζυγία*, properly *derivation*, including inflection as well as formation of new words, but afterward limited to the inflection of verbs, which had previously been called simply *inflection*, or *inflection of verbs* (*κλίσις ῥημάτων*, *declinatio verborum*).]

3. A union or coupling; a combination of two or more individuals. [Obsolete except in specific use. See 4.]

The sixth *conjugation* or pair of nerves.
Sir T. Browne, Vulg. Err., iv. 4.

4. In *biol.*, a union of two distinct cells for reproduction; a temporary or permanent growing together of two or more individuals or cells, with fusion of their plasmodic substance, as a means of reproduction by germs or spores, or a means of renewing individual capacity to multiply by fission. It is a kind of copulation of the entire bodies of different individuals or cells, with the formation of new nuclei or other form-elements, preparatory to the development of new individuals. It is also called *zygosis*, and the resulting blended organism is called a *zygote* or *zygospore*. The process occurs only in the lower animals and plants, among many of which it is an ordinary mode of reproduction. It is very common in protozoans, and has been observed in certain worms. (See *Diplozoön*.) A permanent fusion takes place in the unicellular algæ *Diatomaceæ* and *Desmidiaceæ* by the union of the contents of two separate cells; in the *Zygnemaceæ* and *Mesocarpeæ*, by that of two cells of different filaments or of the same filament; and in the *Zoösporeæ*, by that of zoöspores from different mother-cells. The result of the union in each case is called a *zygospore*; the latter produces a plant similar to that from which it came. The process is considered a sexual one, though the cells which unite cannot be distinguished as male and female.



Cells of a Seaweed (*Spirogyra elongata*) Conjugating, highly magnified.

1. Portions of two filaments preparing for conjugation; a protuberance has arisen from each cell to meet a similar one from the opposite cell. 2. *A*, portions of two filaments whose cells are in the act of conjugating. At the left the protoplasmic body of one cell is passing through and coalescing with that of the opposite cell; at the right this has already taken place. *B*, portion of a filament containing young zygospores, each surrounded by a cell-wall. (From Sachs's "Lehrbuch der Botanik.")

The *conjugation* of the Algæ and of some of the simplest animals is the first step towards sexual reproduction.
Darwin, Cross and Self Fertilisation, p. 400.

The *conjugation* of two Infusoria occurs in very different ways, and leads to more or less complete fusion, which, after regeneration of the nucleus, is followed by an increase in the frequency of fission. Paramœcium, Stentor, Spirostoma, during *conjugation*, become connected by their ventral surfaces; other Infusoria, with a flat body like Oxytrichina or Chilodon, by their sides; while Enchelys, Halteria, Coleps, join together the anterior extremities of their bodies, giving the appearance of transverse fission. A lateral *conjugation* also takes place not infrequently in Vorticella, Trichodina, etc., between individuals of unequal size, the smaller one having the appearance of a bud. *Claus*, Zoölogy (trans.), I. 203.

2. In *astron.*, the meeting of two or more stars or planets in the same longitude: as, the *conjunction* of the moon with the sun, or of Jupiter and Saturn. When a planet, as seen from the earth, is in the same direction as the sun, it is said to be in *conjunction* with the sun. This, however, in the case of an inferior planet, may be either when it passes between the sun and the earth or when it is on the further side of the sun; the former is the *inferior* and the latter the *superior conjunction*. A superior planet can be in conjunction with the sun only when the sun is in a direct line between it and the earth. See *syzygy* and *opposition*.

3. In *gram.*, a connective particle serving to unite clauses of a sentence, or coördinate words in the same sentence or clause, and indicating their relation to one another. There are two principal kinds of conjunctions, *coordinating* and *subordinating*: the former joining clauses of equal order or rank (as, he went *and* I came); the latter joining a subordinate or dependent clause to that on which it depends (as, I went *where* he was; he was gone *when* I came). Most conjunctions are of adverbial origin, and some, as, for instance, *also*, share almost equally the character of both parts of speech.—**Comparative conjunction, conditional conjunction, copulative conjunction**, etc. See the adjectives.—**Ecliptic conjunction.** See *ecliptic*.—**Partile conjunction**†, an exact conjunction.—**Platic conjunction**†, a conjunction within the planets' orbs.

In low vertebrates it is rudimentary and non-secretory, or not to be demonstrated; in the higher vertebrates which have eyelids it is well defined. In birds and many reptiles and mammals it forms a special fold, chiefly constituting the nictitating membrane or third eyelid. It is very delicate where it passes over the cornea, offering no impediment to vision. In snakes which have no eyelids a delicate cuticle continues from the skin over the eye, and is shed with the rest of the cuticle. The membrane is regarded as one of the tunics or coats of the eyeball, like the tunica sclerotica, etc. **2.** In *entom.*, the membrane uniting two sclerites, or hard parts of the integument, which move freely on each other.

In regard to the word black, we merely annex to it the syllable ness; and it is immediately indicated that all *connotation* is dropped. *James Mill*, Human Mind, ix.

2. That which constitutes the meaning of a word; the aggregation of attributes expressed by a word; that which a word means or implies: distinguished from *denotation.* See extract, and *connote, v.*

The more usual mode of declaring the *connotation* of a name is by predicating two or more connotative names which make up among them the whole *connotation* of the name to be defined, as, Man is a corporeal, organized, animated, rational being, shaped so and so; or we may employ names which connote several of the attributes at once, as, Man is a rational animal shaped so and so. *J. S. Mill*, Logic, I. viii. § 2.

connotative (ko-nō'ta-tiv), *a.* [= F. *connotatif* = Sp. Pg. *connotativo*, < ML. *connotativus*, < **connotatus*, pp. of *connotare*, connote: see *connote*, *connotate.*] Having the quality of connoting; implying an attribute while denoting a subject: applied to any term which connotates or connotes anything, in whatever sense those verbs may be used. [The Latin equivalent *connotativus* is frequent in the scholastic writers, from Alexander of Hales, one of the earliest, who gives *relativa appellatio* as the equivalent of *nomen connotans*, to William of Occam, who says: "A *connotative* name is that which signifies one thing primarily and another secondarily; and such a name properly has a nominal definition, . . . and frequently a part of that definition ought to be placed in the nominative and part in an oblique case, . . . as with the noun *white*, . . . that which possesses whiteness." The word is used in this sense in older English writers. Several modern writers, as James Mill, have used it in nearly the same way; but J. S. Mill's influence has established, alongside of the old meaning, another, used by his followers, which is defined in the following extract:

A *connotative* term is one which denotes a subject, and implies an attribute. By a subject is here meant anything which possesses attributes. Thus John, or London, or England, are names which signify a subject only. Whiteness, length, virtue, signify an attribute only. None of these names, therefore, are *connotative.* But white, long, virtuous are *connotative.* The word white denotes all white things, as snow, paper, the foam of the sea, etc., and implies, or, as it was termed by the schoolmen, connotes, the attribute whiteness. *J. S. Mill*, Logic, I. ii. § 5.]

Connotative being. See *being.*

connote (ko-nōt'), *v.*; pret. and pp. *connoted*, ppr. *connoting.* [= Sp. *connotar*, < ML. *connotare*, connote, < L. *com-*, together, + *notare*, mark, note: see *note, v.*, and cf. *connotate.*] **I.** *trans.* **1.** Same as *connotate.*

White, in the phrase white horse, denotes two things, the color and the horse; but it denotes the color primarily, the horse secondarily. We say that it notes the primary, *connotes* the secondary signification. *James Mill*, Human Mind, i.

2. To signify; mean; imply.

It [*Cosmos*] denotes the entire phenomenal universe; it *connotes* the orderly uniformity of nature, and the negation of miracle or extraneous disturbance of any kind. *J. Fiske*, Cosmic Philos., I. 182.

[This meaning was introduced by J. S. Mill. A word *connotes* those attributes which its predication of a subject asserts that that subject possesses. But *connote* is now often loosely used in such a sense that any attribute known to be possessed by all the objects denoted by a term is said to be *connoted* by that term. Mill discountenances this use of the word.

In some cases it is not easy to decide precisely how much a particular word does or does not *connote;* that is, we do not exactly know (the case not having arisen) what degree of difference in the object would occasion a difference in the name. Thus, it is clear that the word man, besides animal life and rationality, *connotes* also a certain external form; but it would be impossible to say precisely what form; that is, to decide how great a deviation from the form ordinarily found in the beings whom we are accustomed to call men would suffice in a newly discovered race to make us refuse them the name of man. *J. S. Mill*, Logic, I. ii. § 5.]

= **Syn.** *Note, Denote, Connote.* See the definitions of these words.

II. *intrans.* To have a meaning or signification in connection with another word.

ȧ	as in ask, fast, ant.
ã	as in fare, hair, bear.

u̇	as in pull, book, could.
ü	German ü, French u.
oi	as in oil, joint, boy.
ou	as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ạ̄	as in prelate, courage, captain.
ẹ̄	as in ablegate, episcopal.
ọ̄	as in abrogate, eulogy, democrat.
ụ̄	as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *u*-sound (of but, pun, etc.). See Preface, p. xi. Thus:

a̤	as in errant, republican.
e̤	as in prudent, difference.
i̤	as in charity, density.
o̤	as in valor, actor, idiot.
ä̤	as in Persia, peninsula.
ē̤	as in *the* book.
ṳ̄	as in nature, feature.

A mark (‿) under the consonants *t*, *d*, *s*, *z* indicates that they in like manner are variable to *ch*, *j*, *sh*, *zh*. Thus:

t̮	as in nature, adventure.
d̮	as in arduous, education.
s̮	as in leisure.
z̮	as in seizure.
th	as in thin.
ᴛʜ	as in then.
ċh	as in German ach, Scotch loch.
ṅ	French nasalizing n, as in ton, en.
ly	(in French words) French liquid (mouillé) l.

ʹ denotes a primary, ʺ a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read *from*; i. e., derived from.

> read *whence*; i. e., from which is derived.

+ read *and*; i. e., compounded with, or with suffix.

= read *cognate with*; i. e., etymologically parallel with.

√ read *root*.

* read *theoretical* or *alleged*; i. e., theoretically assumed, or asserted but unverified, form.

† read *obsolete*.
